Data Flow Diagram

Source-accurate logical flow for the current app.py implementation:

External Entity / Input	Process	Data Store / Output
User enters income, expense, category and note	Validate input and save transaction	SQLite database: income / expenses
User selects period or filters history	Query and aggregate transaction data	Dashboard values and transaction table
User sets monthly budget	Save/read monthly_budget_goal setting	SQLite settings table
User imports CSV	Validate CSV columns and insert transactions	SQLite income / expenses
User requests CSV export	Read transaction data and write CSV	CSV file selected by user
Stored data	Calculate balance, savings rate, budget usage and health score; generate recommendations	Dashboard insights and charts

Data stores identified directly in app.py: income, expenses and settings tables in SQLite.
