

Code Layout, Readability and Reusability

Date	30/09/2026
Team ID	SWTID-2026-7404
Project Name	PocketSmart AI
Maximum Marks	2 Marks

Criterion	Evidence in supplied app.py
Separation of concerns	Database operations, helper functions, calculations, CSV handling and UI construction are grouped into sections.
Reusable functions	Functions such as <code>get_total_income()</code> , <code>get_total_expenses()</code> , <code>get_monthly_budget_goal()</code> , <code>calculate_health_score()</code> and <code>create_button()</code> encapsulate repeated behavior.
Readable naming	Names such as <code>selected_date_range</code> , <code>add_income</code> , <code>add_expense</code> , <code>export_csv</code> and <code>refresh_table</code> describe their roles.
Constants	UI colors and shared state are defined near the top for centralized styling and widget references.
Validation	Income/expense inputs and CSV imports perform validation and show message boxes for errors.
