Project Name	PocketSmart AI
Maximum Marks	4 Marks

Implementation evidence from the supplied app.py

Area	Source implementation
Database setup	sqlite3 connection; CREATE TABLE IF NOT EXISTS for income, expenses and settings.
Budget	monthly_budget_goal is initialized to 25000 and can be changed through the budget dialog.
Income / Expense	add_income() and add_expense() validate amounts and insert records.
Calculations	get_total_income(), get_total_expenses(), calculate_health_score() and savings-rate calculations drive the dashboard.
Recommendations	generate_recommendation() creates insight text based on financial conditions.
CSV	export_csv() writes transaction records; import_csv() validates required columns and inserts records.
UI	build_ui() constructs the Tkinter desktop dashboard, forms, controls, chart and history view.

Representative source code structure

app.py → database setup → helper functions → database operations → calculations / recommendation engine → CSV operations → transaction history → UI construction.
