

Sample Project Documentation

Date	30/09/2026
Team ID	SWTID-2026-7404
Project Name	PocketSmart AI
Maximum Marks	4 Marks

1. Project Overview

PocketSmart AI is described in the README as an AI-powered personal financial assistant for tailored budget insights and savings recommendations. The supplied app.py implements a desktop PocketSmart Budget Planner using Tkinter and SQLite, with transaction tracking, budgeting, financial health calculations, recommendations, charts and CSV exchange.

2. Objectives

Provide a practical personal-finance interface; record income and expenses; monitor a monthly budget; calculate balance and savings-related indicators; provide recommendations; visualize spending; and support CSV import/export.

3. Key Features

Income and expense entry, budget goal, financial overview, spending health score, recommendations, category donut chart, transaction history with filters, CSV import/export and data clearing.

4. Setup

README instructions include cloning the repository, creating a Python virtual environment, activating it on Windows, installing requirements and running python app.py.

5. Technology Note

README names Streamlit and Google Gemini AI, while app.py imports tkinter, sqlite3 and csv and builds the desktop application with Tkinter. The exact source materials therefore document two different technology descriptions; this package does not silently merge them.

6. Database

The current app.py creates income, expenses and settings tables. The monthly budget goal is stored in settings under monthly_budget_goal.
