

Scalability & Future Plan

Date	30/09/2026
Team ID	SWTID-2026-7404
Project Name	PocketSmart AI
Maximum Marks	2 Marks

Current source-supported state

The supplied implementation is a local Python desktop application using SQLite. The README describes a broader Streamlit + Gemini AI direction. Future work should first align the documented architecture with the implementation, then extend the application consistently.

Future Area	Possible Next Step
AI integration	If the Gemini direction is retained, connect the application to Google Gemini using the dependency documented in requirement.txt and clearly separate API-dependent features.
Database	Move from local SQLite to a managed database if multi-user or larger-scale deployment is required.
UI	Improve responsive layout and accessibility while retaining the current dashboard concepts.
Data	Add richer analytics, more import/export formats and backup workflows.
Testing	Add automated unit and integration tests and record measured performance results.
Security	Protect sensitive financial data and use secure configuration for external API credentials.
